

Automated Softener with Dual Filters 20 x 4.5” Whole House Water Filtration System

The automated softener with dual filters, is a whole house water filtration system, that is the best and most capable solution for areas connected to the local water system which have **hard water**. The package is best suited to larger households with a high-water usage. However, it can still be used for all sized homes.

The system utilises a twin 20x4.5” filter assembly that removes sediment, chlorine, taste and odour. After this the water passes into the SOL40, an automated water softening system. The water softeners are considered autonomous as they automatically regenerate the water softening resin using softener salt, preserving the softener resin for a long life.

- Filter 1 – Sediment reduction
- Filter 2 – Chlorine, Taste & Odour reduction
- SOL40 – Calcium reduction (water softening of hard water)

The system requires the two filters to be changed approximately every 6-12 months, depending on water supply quality and water usage in the home. Salt is added to the softener approximately every 2-3 months, to ensure salt is available for each time the softener backwashes. This is the only maintenance required for the system. The automated softener backwash, ensures the softener resin is kept in good condition versus other systems that require softener resin cartridge replacement on a regular basis.

Price for system is \$3,590.00 incl GST excludes salt & installation
